CALCULATION AND ANALYSIS OF RUTHERFORD SCATTERING

Annotation: Consider the scattering of Rutherford into 35 and 45 degrees. In order to analyse the results, the techniques such as Full width at half maximum (FWHM), angular distribution and Gaussian distribution had been used on the research.

Key words: scattering, width, angular distribution, cross section.

Introduction

Rutherford scattering is an elastic scattering of charged particles by Coulomb interaction. It was first referred to Coulomb scattering because it relies only upon static electric (Coulomb forces), and the minimal distance between particles is a set only by this potential. The classical Rutherford scattering of alpha particles against gold nuclei is an example of "elastic scattering" because the energy and velocity of the outgoing scattered particle are the same as that with which it began [1].

- measure the number of alpha particles which are scattered out of collimated beam upon hitting a thin metal foil
- They determined the angular distribution of scattered particles for several different materials, thicknesses and alpha energies

Kinematics. We use the following formulas to calculate the energy of particles for each scattering angles [2].

$$P_0 = P_m \cos \theta + P_M \cos \theta \quad (1)$$

$$E_0 = E_m + E_M \quad (2)$$

$$P_m \sin \theta = P_M \sin \phi \quad (3)$$

$$E_0 = \frac{p_0^2}{2m} \quad (4)$$

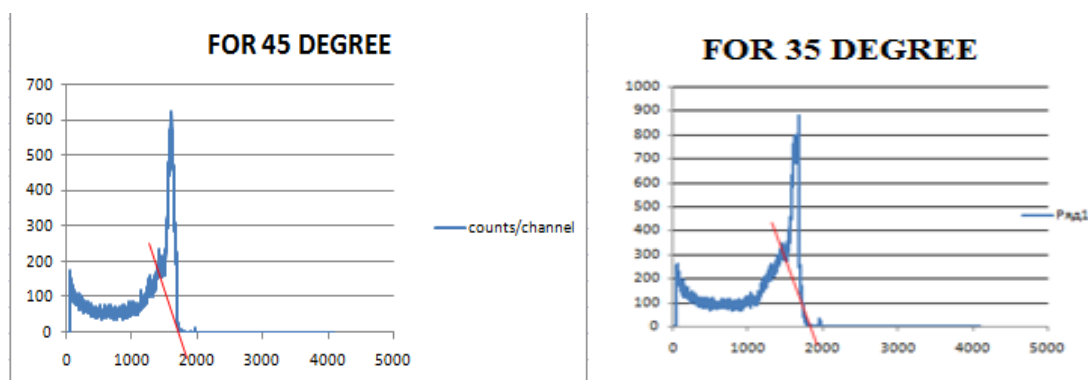

$$E_0 = \frac{p_m^2}{2m} \quad (5)$$

$$E_0 = \frac{p_M^2}{2m} \quad (6)$$

Analysis of results

For calculations, a value of the amplitude in Excel program had been used.

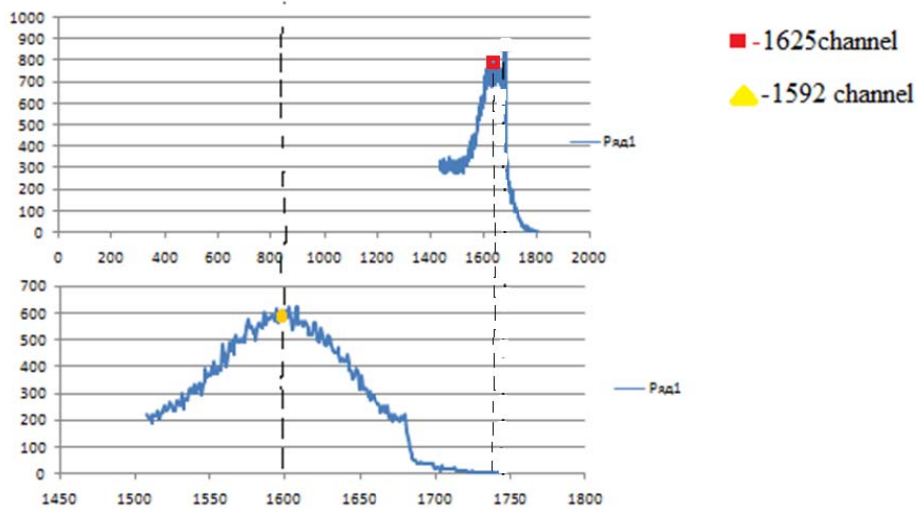

1. The angle of scattering of alpha particles by 35 and 45 degrees had been measured by the research team. The first, there were obtained 2 graphs for two angles:

2. Only the peak that points when graph increased and decreased had been cut out for the research convenience.

3. Then, the research team compared the two pick of angles in order to find the difference of channels.

$$1625-1592=33\text{channel}$$

4. Moreover, calculations of the energy for each angles had been made by using (5) and (6) formulas:

Energy for 35 degree: $E=29.604\text{MeV}$

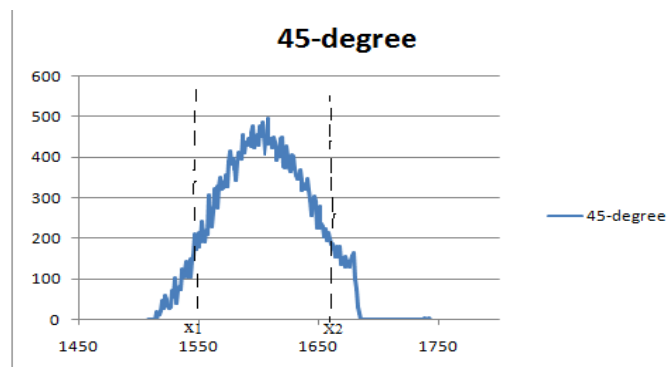

Energy for 45 degree: $E=29.355\text{MeV}$

5. Using the difference of energies the energy for each channels can be found.

$$\Delta E=E_2-E_1=250\text{KeV}$$

$$\Delta E/\text{channel}=250\text{keV}/33\text{ch}=7.5\text{keV}$$

6. The next step is to find the width of scattering. For this step, there been used the method of Gauss in order to calculate the distance between two extreme values. If the number of events is very large, then the Gaussian distribution function may be used to describe the physical events [3]. Furthermore, the methods as a FWHM had been used. Full width at half maximum (FWHM) is an expression of the extent of a function given by the difference between two extreme values of the independent variable at which the dependent variable is equal to half of its maximum value [4]. In other words, it is the width of a spectrum curve measured between those points on the y-axis which are half of the maximum amplitude [5].

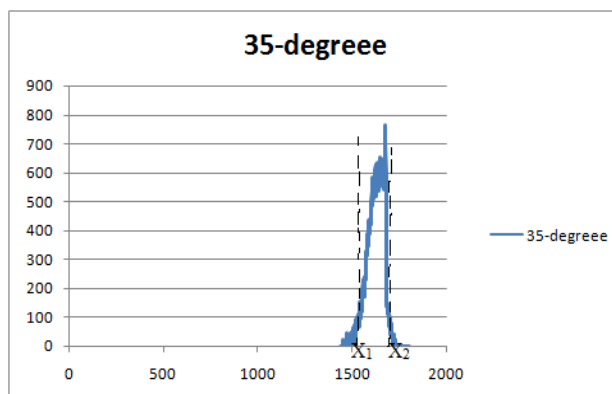

$$\Delta x=x_2-x_1$$

the width of scattering

$$X_1=1550$$

$$X_2=1665$$

$$\Delta x=1665-1550=115$$

$$\begin{aligned} X1 &= 1556 \\ X2 &= 1691 \\ \Delta x &= 1691 - 1556 = 135 \end{aligned}$$

7. Angular distribution is the distribution of relatives to the scattered particles and product of nuclear reactions [6].

$$\frac{d\sigma}{d\Omega} = \frac{N_i n L Z^2 k^2 e^2}{4r^2 KE^2 \sin^4(\theta_1/2)} \quad \text{for 35 degree}$$

$$\frac{d\sigma}{d\Omega} = \frac{N_i n L Z^2 k^2 e^2}{4r^2 KE^2 \sin^4(\theta_2/2)} \quad \text{for 45 degree}$$

$$\text{Integer35} / \text{integer45} = \sin^4(\Theta_1/2) / \sin^4(\Theta_2/2)$$

$$\text{Integer35} = \sum y_i \quad \text{Integer45} = \sum y_i$$

$$\blacktriangleright \text{Integer35} = \sum y_i = 71334$$

$$\blacktriangleright \text{Integer45} = \sum y_i = 131361$$

$$\text{Integer35} \setminus \text{Integer45} = 0.54$$

$$\sin^4(\Theta_1/2) / \sin^4(\Theta_2/2) = 0.0081 / 0.0256 = 0.32$$

Conclusion

Undoubtedly, the planetary model of an atom was proposed by Rutherford, a major step forward to the development of knowledge about the structure of an atom [7]. It was absolutely necessary to explain the experiments on the scattering of α -particles. α -scattering particles 35 and 45 degree were investigated during the study. The aim of our work was to get the scattering of spectrum of α -particles in the corners 35 and 45 degrees and make calculations by analyzing them. There were used methods, such as: full width at half maximum (FWHM), angular distribution, Gaussian distribution and so on. The results of angles were compared between each other. Calculations were made on energy, width, angular distribution and cross section. Comparison with the final value of section was made. According to the perceived data, it had to be the same, but on identified errors in the experiment they had a minimum difference to 0.22. Consequently there was accomplished all the set of purpose.

Publication Ethics and Publication Malpractice in the journals of the National Academy of Sciences of the Republic of Kazakhstan

For information on Ethics in publishing and Ethical guidelines for journal publication see <http://www.elsevier.com/publishingethics> and <http://www.elsevier.com/journal-authors/ethics>.

Submission of an article to the National Academy of Sciences of the Republic of Kazakhstan implies that the work described has not been published previously (except in the form of an abstract or as part of a published lecture or academic thesis or as an electronic preprint, see <http://www.elsevier.com/postingpolicy>), that it is not under consideration for publication elsewhere, that its publication is approved by all authors and tacitly or explicitly by the responsible authorities where the work was carried out, and that, if accepted, it will not be published elsewhere in the same form, in English or in any other language, including electronically without the written consent of the copyright-holder. In particular, translations into English of papers already published in another language are not accepted.

No other forms of scientific misconduct are allowed, such as plagiarism, falsification, fraudulent data, incorrect interpretation of other works, incorrect citations, etc. The National Academy of Sciences of the Republic of Kazakhstan follows the Code of Conduct of the Committee on Publication Ethics (COPE), and follows the COPE Flowcharts for Resolving Cases of Suspected Misconduct (http://publicationethics.org/files/u2/New_Code.pdf). To verify originality, your article may be checked by the originality detection service Cross Check <http://www.elsevier.com/editors/plagdetect>.

The authors are obliged to participate in peer review process and be ready to provide corrections, clarifications, retractions and apologies when needed. All authors of a paper should have significantly contributed to the research.

The reviewers should provide objective judgments and should point out relevant published works which are not yet cited. Reviewed articles should be treated confidentially. The reviewers will be chosen in such a way that there is no conflict of interests with respect to the research, the authors and/or the research funders.

The editors have complete responsibility and authority to reject or accept a paper, and they will only accept a paper when reasonably certain. They will preserve anonymity of reviewers and promote publication of corrections, clarifications, retractions and apologies when needed. The acceptance of a paper automatically implies the copyright transfer to the National Academy of sciences of the Republic of Kazakhstan.

The Editorial Board of the National Academy of sciences of the Republic of Kazakhstan will monitor and safeguard publishing ethics.
